

## Why heat recovery ventilation?

This is one of numerous questions more and more builders ask themselves today when it comes to ventilation of living spaces – since it has become commonplace nowadays in modern building construction that homes are virtually airtight due to legal standards and in order to save energy. Heat recovery ventilation provides evenly distributed air exchange that can be individually and automatically controlled.

The major advantages of heat recovery ventilation will be presented to you [here](#).

## Proper filters for hygienically safe ventilation of living spaces

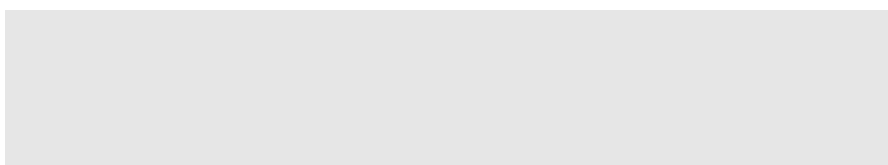

Regular air exchange can help to prevent the spread of pathogens; so, fresh air is not only a matter of well-being, it also affects our health. Heat recovery ventilation automatically provides continuous supply of fresh air. The use of fresh air filters prevents the viruses and bacteria from entering the building and spreading in it. If the right filters are installed, the operation of a ventilation system will be hygienically impeccable.

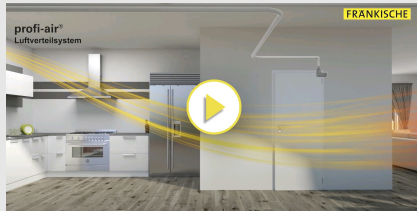

**Opt for FRÄNKISCHE quality with our original profi-air filters – available in a number of filter classes.**
